Case Study – I

Note: This Case Study spans across the modules of the training. This is Case Study Part-I. The subsequent parts can be found in Modules – 4, 6, and 8. Each Case Study will have objectives relating to the modules completed before it.

Problem Statement

You are working with a web development agency that highly relies on Drupal as their base framework for developing web applications for their clients. So far, you have been deploying Drupal manually across all the servers but now the firm wants to have the process streamlined and automated.

Objectives:

- Install the latest Docker engine on Linux flavor of your choice (CentOS or Ubuntu)
- Pull Nginx image and create a container that is exposed on the port 8080 of your server
